Answer: A

NEW QUESTION: 3

일부 범용 (SSD) 및 프로비저닝 된 IOPS (SSD) 볼륨에서 워크로드를 확인하고 있는데 I / O 지연 시간이 필요한 것보다 더 높은 것 같습니다. 애플리케이션이 프로비저닝 한 것보다 더 많은 IOPS를 구동하려고 하지 않는지 확인하려면 _____을 확인해야 합니다.

- A. 스토리지 서브 시스템의 승인
- B. 사용 가능한 IOPS 양
- C. 평균 대기열 길이
- D. I / O 작업이 완료되는 데 걸리는 시간

Answer: C

Explanation:

In EBS workload demand plays an important role in getting the most out of your General Purpose (SSD) and Provisioned IOPS (SSD) volumes. In order for your volumes to deliver the amount of IOPS that are available, they need to have enough I/O requests sent to them. There is a relationship between the demand on the volumes, the amount of IOPS that are available to them, and the latency of the request (the amount of time it takes for the I/O operation to complete).

Latency is the true end-to-end client time of an I/O operation; in other words, when the client sends a IO, how long does it take to get an acknowledgement from the storage subsystem that the IO read or write is complete.

If your I/O latency is higher than you require, check your average queue length to make sure that your application is not trying to drive more IOPS than you have provisioned. You can maintain high IOPS while keeping latency down by maintaining a low average queue length (which is achieved by provisioning more IOPS for your volume).
