NEW QUESTION: 1

Which connection can use load balancing?

- A. Policy Server to User Store
- B. Reporting Server to Policy Server
- C. Administrative UI to Policy Server
- D. Reporting Server to Report Database

Answer: A

NEW QUESTION: 2

Exhibit:

You are troubleshooting disk connectivity issues on an SC9000. The SC9000 has two SC220 enclosures on one chain and two SC280 enclosures on the other chain. You verify the physical cabling and discover the array is cabled as shown in the exhibit.

What identifies the issue with how the environment is cabled?

- A. Chain containing the SC280 storage enclosures must be divided into two separate chains
- B. Chain containing the SC220 storage enclosures is cabled incorrectly
- C. Chain containing the SC220 storage enclosures is cabled incorrectly
- D. Chain containing the SC220 storage enclosures must be divided into two separate chains

Answer: D

NEW QUESTION: 3

Note: This question is part of a series of questions that use the same scenario. For your convenience, the scenario is repeated in each question. Each question presents a different goal and answer choices, but the text of the scenario is exactly the same in each question in this series.

You are a database administrator for a company that has an on-premises Microsoft SQL Server environment and Microsoft Azure SQL Database instances. The environment hosts several customer databases, and each customer uses a dedicated instance. The environments that you manage are shown in the following table.

You need to configure the Contoso instance.

How should you complete the Transact-SQL statement? To answer, select the appropriate Transact-SQL segments in the answer area.

Answer:

Explanation:

Explanation

Box 1: show advanced options

Advanced configuration options are displayed by first setting show advanced option to 1.

Box 2: max worker threads

SQL Server uses the native thread services of the operating systems so that one or more threads support each network that SQL Server supports simultaneously, another thread handles database checkpoints, and a pool of threads handles all users. The default value for max worker threads is 0. This enables SQL Server to automatically configure the number of worker threads at startup. The default setting is best for most systems.
